The complete description of the platform

Everything Cendoor does, in one page

Cendoor is an AI service for small Moroccan sellers on Instagram, TikTok and WhatsApp. It builds the seller's shop from a chat, answers customers, takes and confirms orders, tracks deliveries and cash, and sends offers and ads. This page explains every part, shows the real screens, and says plainly what works today and what needs approval from someone else.

Status on every feature: Live in the demo | Simulated in the demo | Needs approval or a partner | Planned, not built

Overview

A seller who sells on Instagram, TikTok or WhatsApp spends the day answering messages, writing down orders, phoning customers to confirm, and chasing carriers. Cendoor takes over those jobs. **The seller makes the content and ships the parcel; Cendoor does the rest.**

1 link
for the bio; every post can have its own tracked link

3 languages
Arabic, French, English on the site and dashboard; the AI also understands Darija

119
automated checks pass on the demo (shop builder, chat, orders, security, ads flow)

14 days
free trial, then Solo 149 MAD or Growth 299 MAD a month

Build

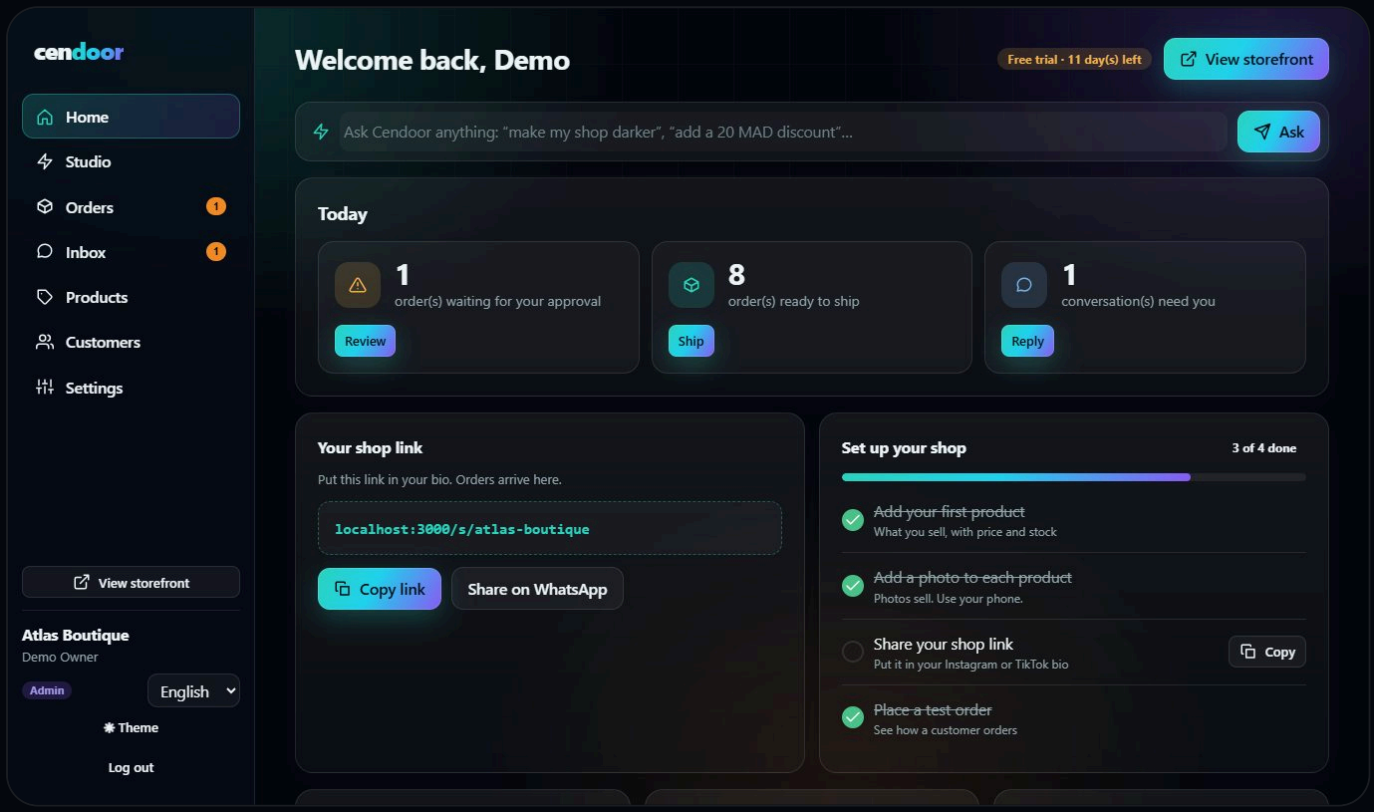

Describe the shop in a sentence. The AI designs a different website each time, with the seller's photos, products, stock and delivery. Change anything by chatting, or edit text and photos by hand.

Confirm

The AI takes the order in the customer's language, checks it for risk, asks the customer to confirm, and shows the seller what needs approval. Fewer silent or refused cash-on-delivery orders.

Deliver and grow

Labels, carrier choice, tracking updates, cash on delivery tracked, failed deliveries chased, offers to past customers, ads from one button, and advice from the seller's own sales.

The seller's home screen: today's tasks, the shop link, a setup checklist and three numbers. Everything else is one click away.

The seller journey, step by step

What the seller does, what the customer does, and what Cendoor does, from the first minute to a delivered order.

Set up (about 10 minutes, once)

1 SELLER

Create an account

Free for 14 days, no card. Arabic, French or English.

2 SELLER

Tell the AI what you sell

Type or speak. Add photos and prices. Say how you want it to look.

3 CENDOOR

The shop appears

A website made for you: photos, products, delivery, stock. Not a template.

4 SELLER

Share one link

Put it in the Instagram or TikTok bio, in stories and in the WhatsApp status.

Sell and deliver (every day)

5 CUSTOMER

Orders

From the link, the quick form, or by chatting. Cendoor answers in Darija, French, Arabic or English, day and night.

6 CENDOOR

Checks and confirms

Risk score, then the AI asks the customer to confirm. The seller approves with a tap.

7 SELLER

Packs and ships

Prints the label, the best carrier is suggested, stock updates everywhere.

8 CENDOOR

Tracks and settles

Updates the customer, tracks cash on delivery, chases failed deliveries, asks for a review.

Grow (when ready)

9 SELLER

Offers to past customers

Pick who gets it by city, product, spend. See what it brought in.

10 SELLER

Launch an ad

One button, from the seller's own ad account, with a hard budget cap.

11 CENDOOR

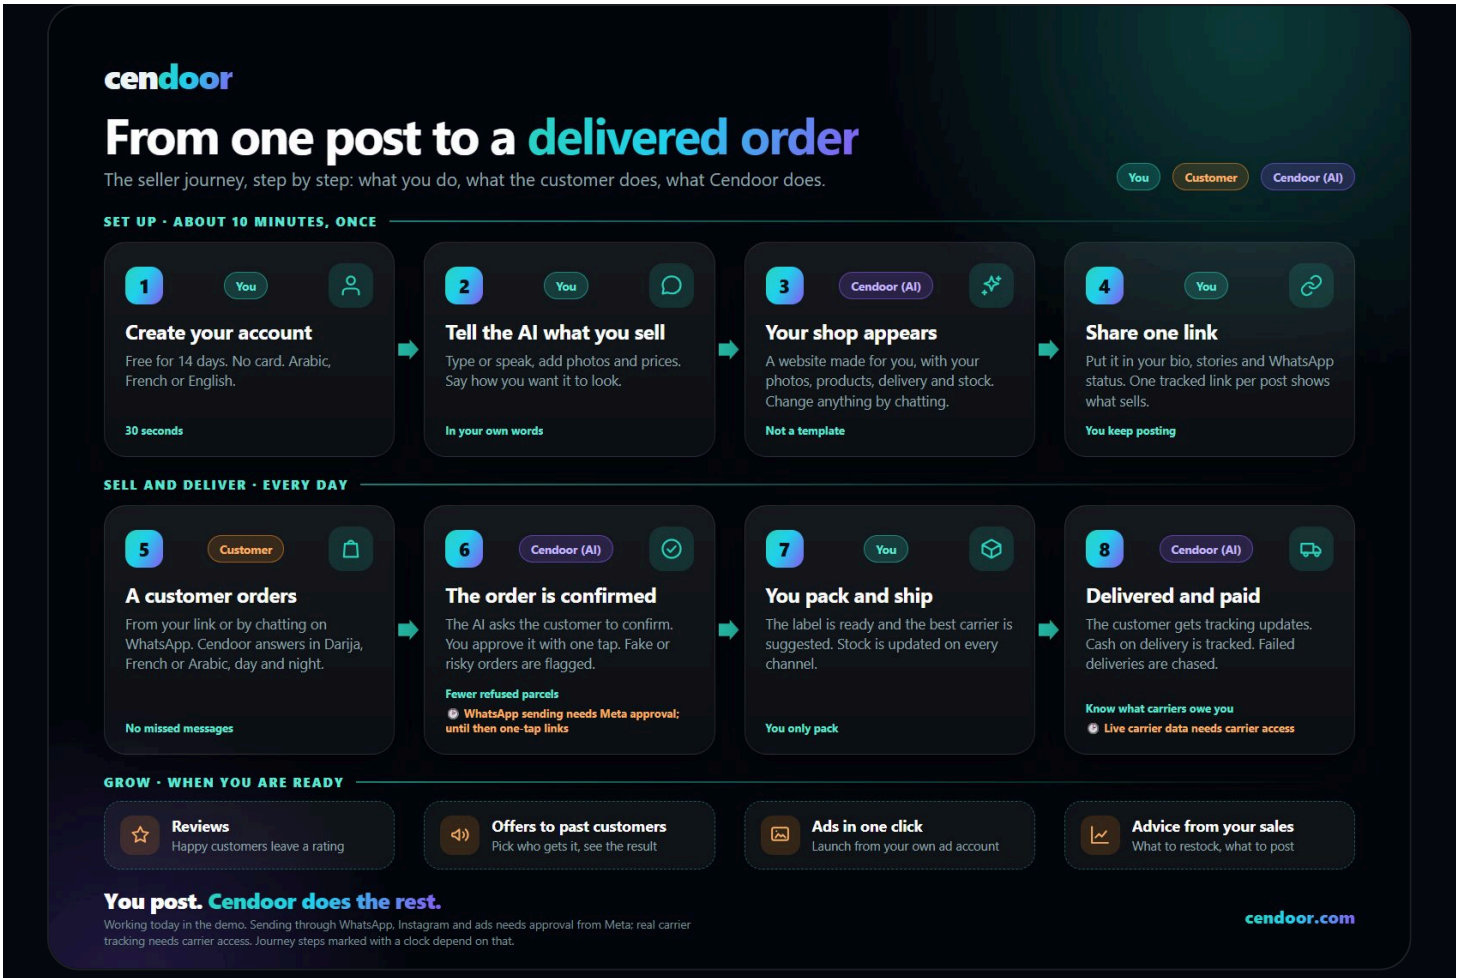

Advice

What to restock, which post sells, which carrier fails, who to win back.

12 SELLER

Add the team

Manager, operator and viewer roles with their own permissions.

The same journey as a poster (A3, English, French and Arabic): download.

1 The shop — Live in the demo

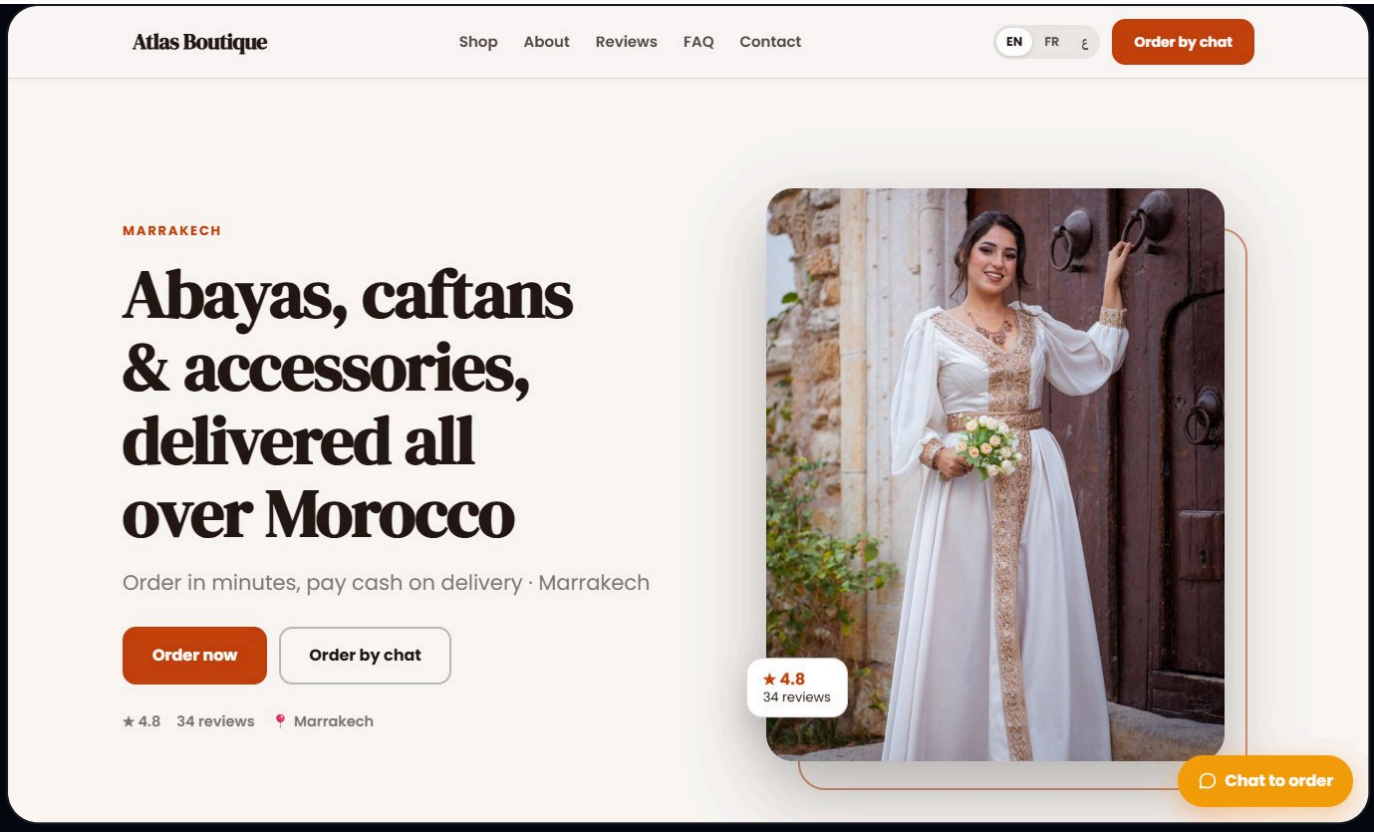

Each seller gets their own website at a link like `/s/your-shop`, built from a description, not from a template.

It is generated, not templated

The generator composes the page from independent parts (header, hero, value strip, product layout, About, reviews, FAQ, footer), each with several layouts. A palette is derived from the colours and mood the seller asks for, with one of 14 font pairings (Latin and Arabic), a shape language and its own artwork. Asking for "another version" gives a genuinely different site.

elegant · luxury · minimal · bold · playful · futuristic · natural · warm

The demo shop on a computer: real photos, delivery and cash-on-delivery promises, a product grid that never ends on a lonely card, reviews, FAQ and a chat button.

What every shop includes

- Product catalogue with variants (colour, size), price, stock and categories
- Photos: hero, About, logo and every product
- Announcement bar, reviews, FAQ, delivery and contact sections
- Cash on delivery, delivery fee by city, free-shipping threshold
- A chat button and a quick order form
- Mobile first, right-to-left for Arabic, calm scroll animations

Photos and starter content

- Sellers upload their own photos (hero, About, logo, each product)
- A new seller who accepts sample products also gets matching starter photos for the category (home, beauty, food, fashion, shoes and bags, other)
- The seller's own photos are never replaced
- Products can be imported from a CSV file

Advanced AI design

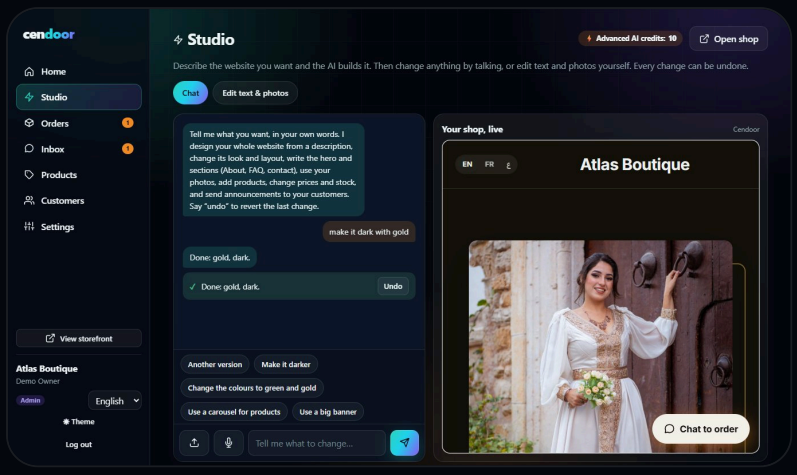

Needs an AI key

For designs the generator cannot express, Claude can write a bespoke page through a strict safety filter. This uses AI credits (10 on the trial, 0 on Solo, 100 a month on Growth). Everyday customisation never uses credits. This mode has not yet run against a real key.

2 The Studio: run the shop by talking

Live in the demo

A chat assistant that changes the shop, the products and the customers' messages from plain sentences, in Arabic, French, English or Darija, by typing or by voice. Every change can be undone.

"Make it dark with gold": the shop on the right regenerates, and the change can be undone.

What you can say

- "Build my website: elegant abayas, black and gold"
- "Another version" / "use a carousel for products" / "big banner"
- "Make it dark" / "serif font" / "use gold and green"
- "Hero title: The caftan season is here"
- "Add an About section: ..." / "add FAQ: question? answer"
- "Add my Instagram" / "use this photo as my main photo"
- "Add product: black abaya 350 dirham 12 pieces"
- "Add 10 to the perfume" / "change the price of the bag to 390"
- "How much did I sell today?"
- "Send an offer to customers in Rabat who spent over 300"
- "Undo"

Rules first, AI when needed

The built-in understanding handles the common requests instantly and for free. Only requests it cannot understand go to Claude, and only if the shop has AI credits and a key is set. A failed AI call costs nothing.

Edit by hand too

"Edit text and photos" lets the seller change the name, tagline, announcement bar, hero text, About, footer, contact links and photos directly, free.

Always reversible

Every Studio change is logged and can be undone, including a build or the sample products.

3 Customer chat and orders

Live in the demo

Customers can order from the shop's chat, from the quick form, or (once connected) on WhatsApp. The assistant takes the whole order and answers questions about products, price, stock and delivery.

What the assistant understands

- Darija, Arabizi, French, Arabic and English, mixed in one message
- Moroccan cities, phone formats (06, 07, +212), addresses
- Products by name, nickname or category; sizes and colours; quantities
- "How much?", "do you have it in black?", "when will it arrive?"
- Voice input in the shop chat where the browser supports it

What it does

- Collects product, variant, name, phone, city and address, one question at a time
- Quotes the total with the delivery fee for that city
- Creates the order, reserves stock and links it to the conversation
- Passes the conversation to the seller when it is unsure

Honest status: the web chat works end to end. The same conversations on WhatsApp need a verified business and approved templates from Meta; Instagram and TikTok messages need platform approval. Until then every message is prepared for the seller to send with one tap. Voice notes sent by customers are flagged for the seller, not transcribed.

4 Order confirmation and risk

Live in the demo

Cash on delivery fails when a customer orders and then goes silent or refuses the parcel. Cendoor checks each order and asks the customer to confirm before the seller ships.

The confirmation agent

Live

- An order from the quick form waits as "pending confirmation" and starts a conversation
- The AI messages the customer: order number, total, city, "reply YES to confirm"
- YES confirms the order automatically; NO cancels it and restores stock
- The seller sees what is waiting on the Home screen and can approve by hand
- It can be switched off in Settings

The risk check

Live

Every order gets a green, yellow or red risk level from visible reasons:

- invalid phone number, new customer, short address
- this customer's past failed or delivered orders
- a duplicate order in the last hours, a very high amount
- the shared signal from other sellers (below)

Cendoor Shield

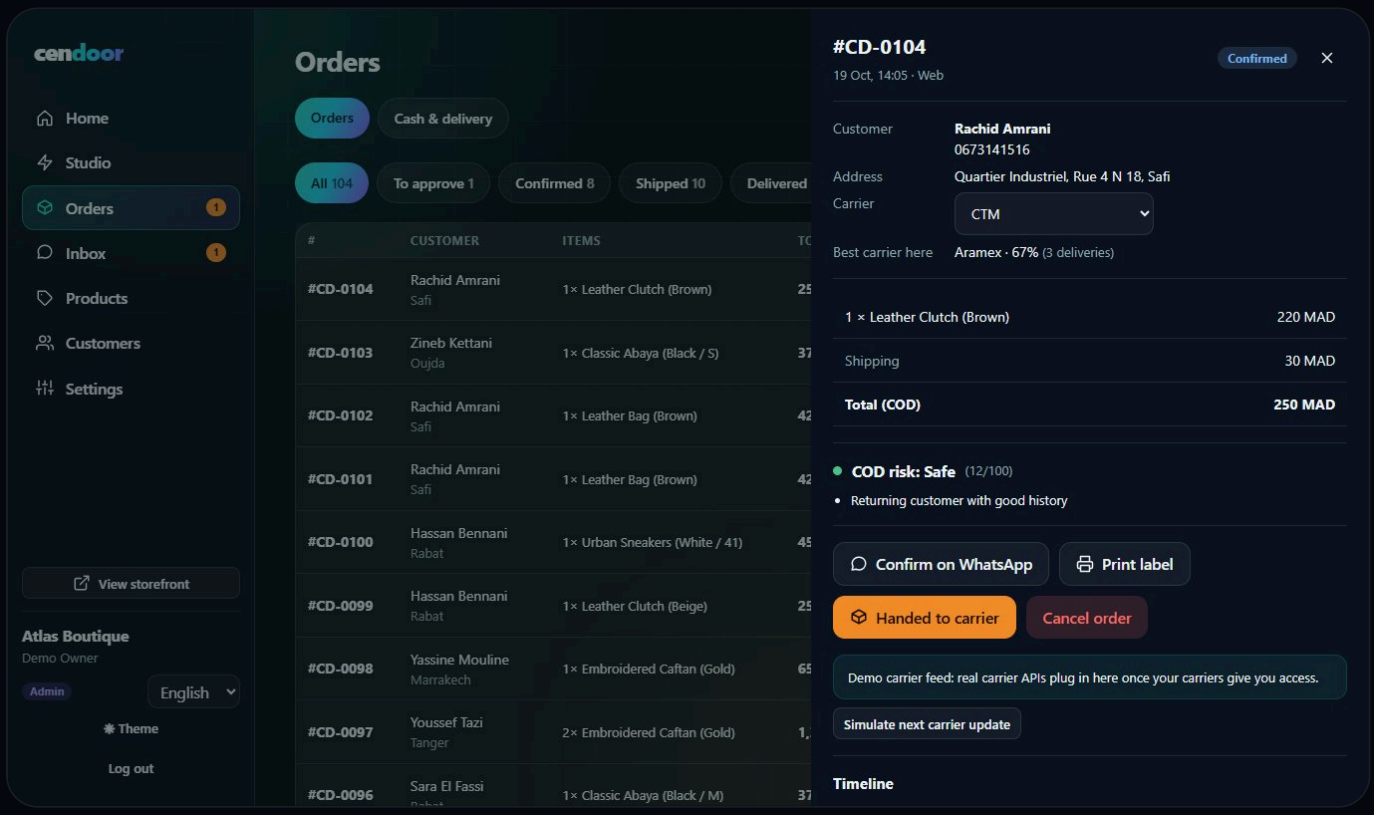

Needs many sellers

A scrambled (hashed) version of a customer's phone number with counts of delivered and failed orders, shared across sellers. No names, addresses or seller identities are stored or shown. With few sellers it carries little information.

Approve before send

Planned

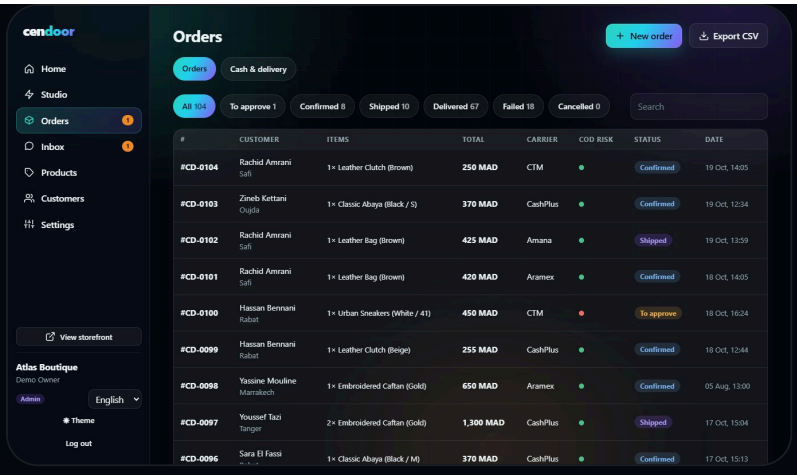

For the first days, every message to a customer waits for the seller's tap, with an always-approve option and a per-shop kill switch. Not built yet; it is the first item in the roadmap because trust is the top objection from sellers.

An order: customer, items, risk level with its reasons, delivery status, and the actions available (confirm, ship, mark delivered, mark failed, print label).

5 Orders and shipping

Live in the demo

One list for every channel, filtered by status, with the cash-on-delivery risk dot on each order.

What the seller can do

- See all orders, filter by status (to approve, confirmed, shipped, delivered, failed, cancelled), search
- Create an order by hand (a customer who phoned or wrote privately)
- Confirm, ship, mark delivered or failed, cancel (stock is restored)
- **Print a shipping label** (A6, with a barcode of the tracking number)
- Export all orders to a CSV file
- One stock across every channel, with low-stock alerts

Carriers

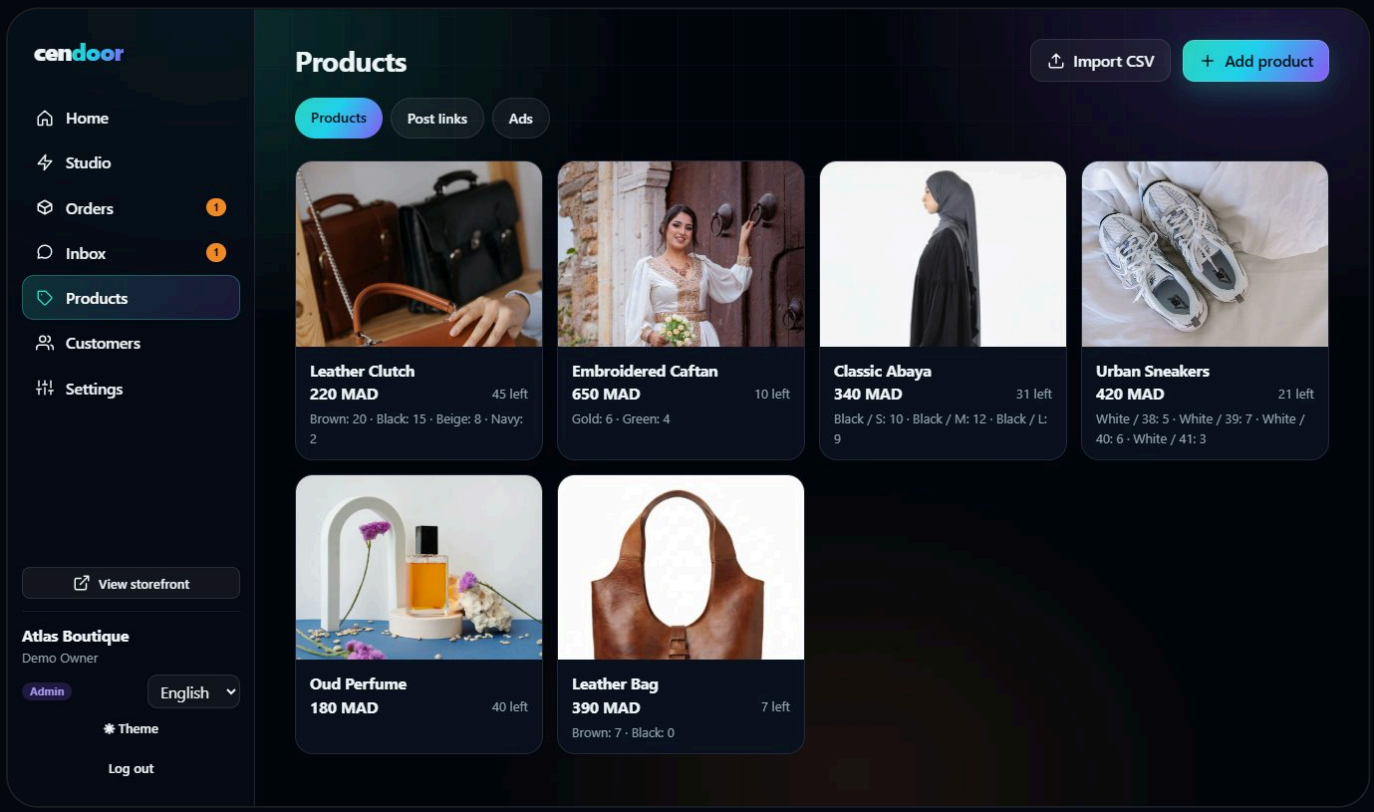

Amana, CTM, Aramex and CashPlus come set up, with a base price and per-city prices. The seller can edit them.

Automatic carrier choice

Cendoor learns from the seller's own history which carrier delivers best to each city and can choose it automatically.

Products and stock

Variants with their own stock, price changes by sentence, CSV import, archive and restock, and a "running low" warning with how long it will last.

Products with photos, price and stock per variant.

Honest status: the carrier's real tracking feed is simulated by a button in the demo. Live carrier status needs each carrier's API access.

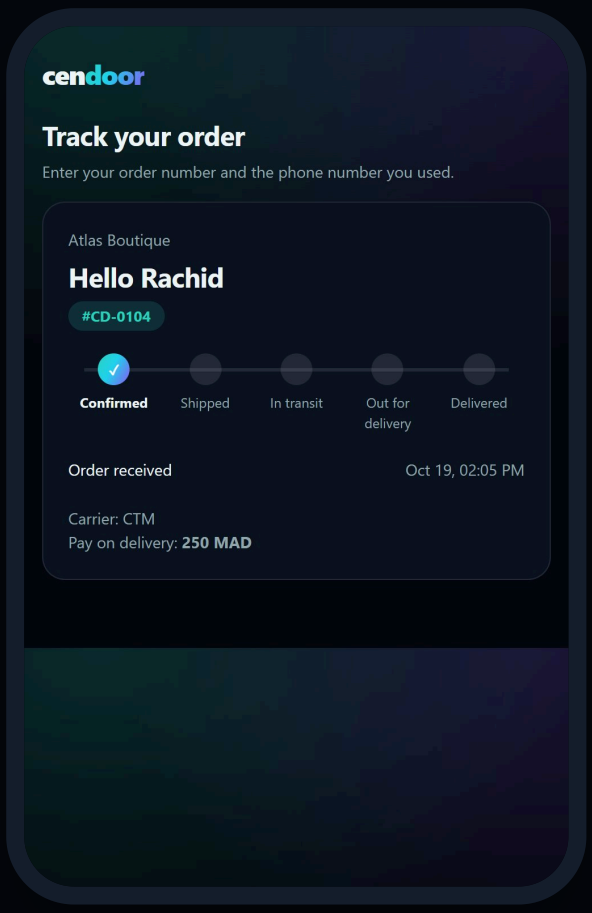

6 Tracking, cash and failed deliveries

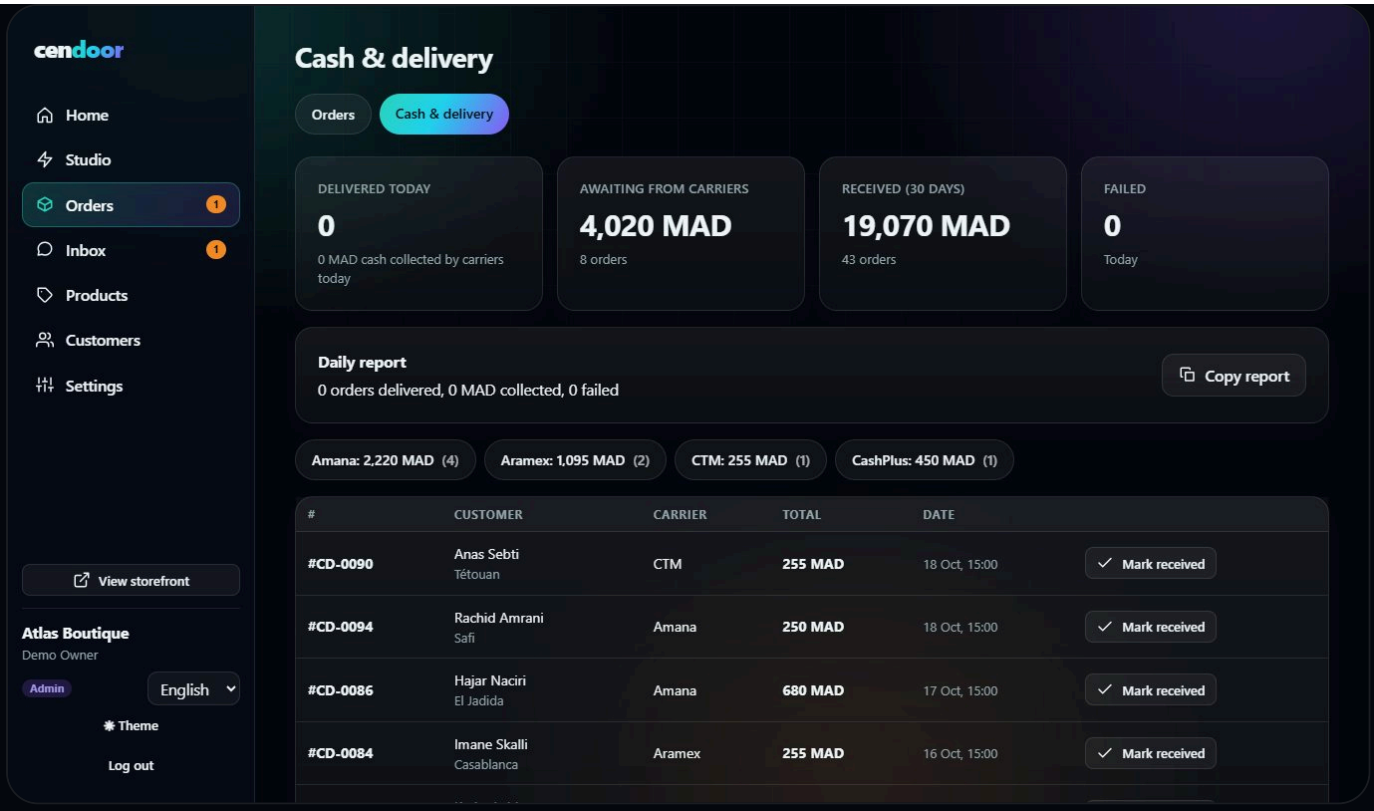

For the customer Live

- A tracking page that needs both the order number and the phone number used, so it is private
- The steps of the order from confirmed to delivered, in the customer's language
- Automatic status messages with the tracking link (prepared for the seller to send until WhatsApp is connected)

For the seller Live

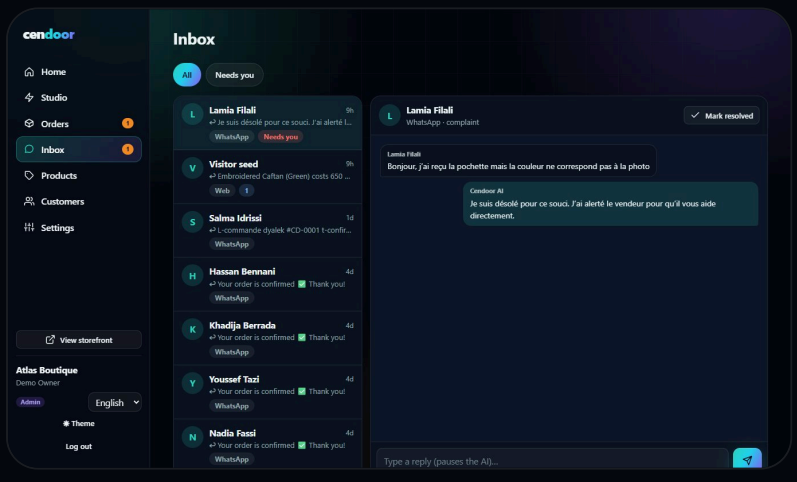

- **Cash and delivery** screen: what each carrier owes, what has been remitted, what is still pending
- Delivery success rate and refused orders
- **Failed-delivery recovery:** the AI asks the customer why, offers to redeliver or cancel, and restocks if cancelled
- A review request after a delivered order

Cash on delivery: what each carrier holds for the seller.

7 The inbox Live in the demo

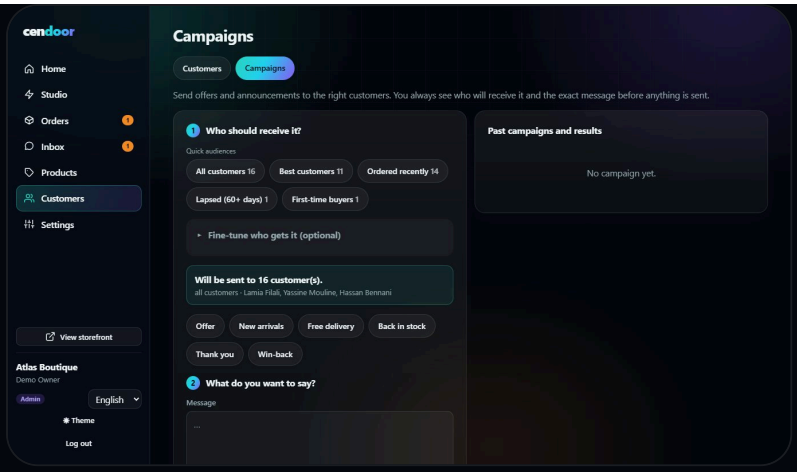

Every conversation in one place, with the AI's replies and the customer's messages.

How it works

- Web chat conversations (and WhatsApp ones once connected) appear in one list
- The AI answers; the seller can read everything in real time
- **Take over** any conversation: the AI pauses and the seller types
- Conversations that need a human are flagged (unclear message, voice note, upset customer)
- Unread counts show on the menu

8 Customers and offers Live in the demo

Every customer who orders is saved with their orders, spend and delivery history. The seller can send an offer or an announcement to exactly the right customers, and always sees who will get it and the exact message first.

Three steps: who gets it, what to say, send. The fine-tuning filters stay folded away until needed.

Targeting

- Quick audiences: all, best customers, ordered recently, lapsed, first-time buyers
- Fine-tune by city, product or category bought, total spent, number of orders, last order date, the channel they ordered from, and reliable delivery history
- Live count and sample names; save an audience to reuse

Writing

One-tap drafts in three languages (offer, new arrivals, free delivery, back in stock, thank you, win-back). Personalise with {name}, {city}, {last_product} and a tracked {link}.

Safety

Preview and confirmation before sending. Customers who reply STOP are excluded for good. At most 3 campaigns a day and 500 recipients each.

Results

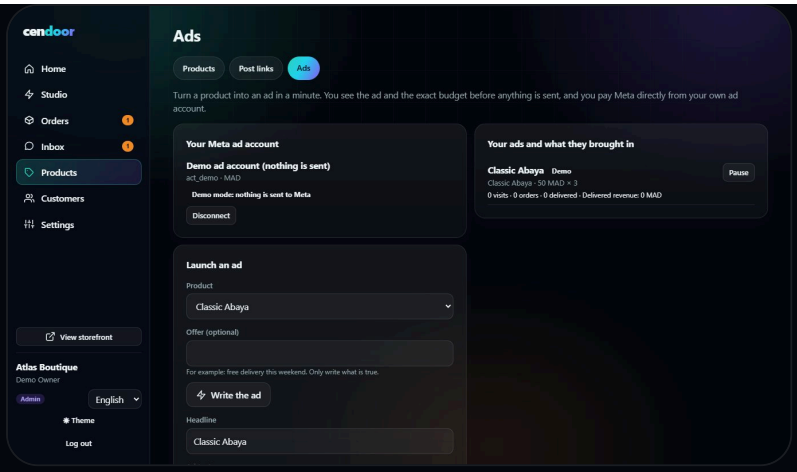

Every campaign gets its own tracked link: the seller sees the visits, orders and revenue it brought in.

Honest status: sending through WhatsApp needs approval from Meta and approved message templates. Until then each message is queued with a one-tap WhatsApp link for the seller. Moroccan data-protection law (09-08) requires the customer's consent for marketing messages and a declaration to the CNDP; the legal drafts are in the documentation pack and must be reviewed by a lawyer.

9 Ads from one button

Dry run in the demo · Needs Meta approval

A seller who already advertises on Meta connects their own ad account, picks a product, reviews the ad and the exact budget, confirms, and Cendoor creates the campaign in their account. The seller pays Meta directly; Cendoor never holds ad money.

A product becomes an ad: copy written in the seller's language, a preview, the budget and the total it can cost.

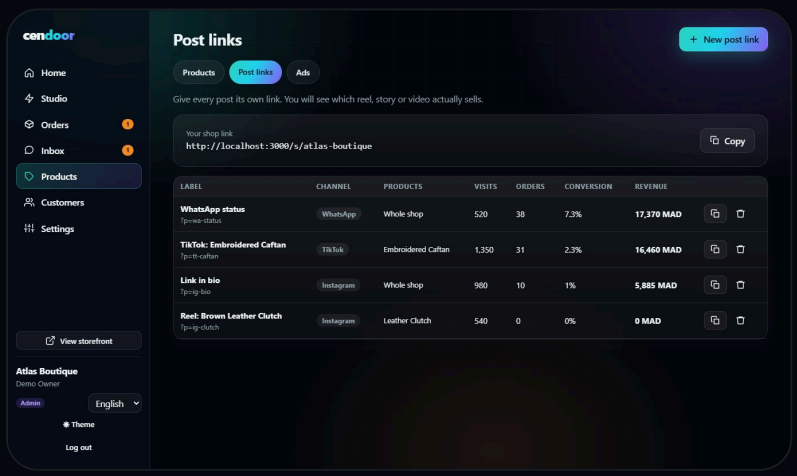

The safeguards

- Nothing is created without an explicit confirmation
- 20 to 300 MAD a day, up to 14 days, up to 2,000 MAD in total, 3 running ads
- Everything is created paused and switched on only when all parts exist; if Meta refuses halfway, nothing is left running
- Access tokens are stored encrypted
- Each ad gets a tracked link; the report counts **delivered** orders against the budget that has run

Honest status: the flow runs fully in the demo as a dry run. The calls to Meta follow its documented format but have never run against Meta's live servers. Connecting other sellers' accounts needs a Meta app approved by Meta (app review and business verification); before that only people added to the app can connect, which is enough for a pilot. TikTok ads and WhatsApp-click ads are not built.

10 Links, numbers and advice

Live in the demo

One tracked link per post shows which reel or story really sells.

Post links

- A link per reel, story, video or WhatsApp status, with its own visits, orders and revenue
- A ready-to-paste caption with the link, in the seller's language
- Orders keep their source, so the seller sees what each post earned

Numbers on the Home screen

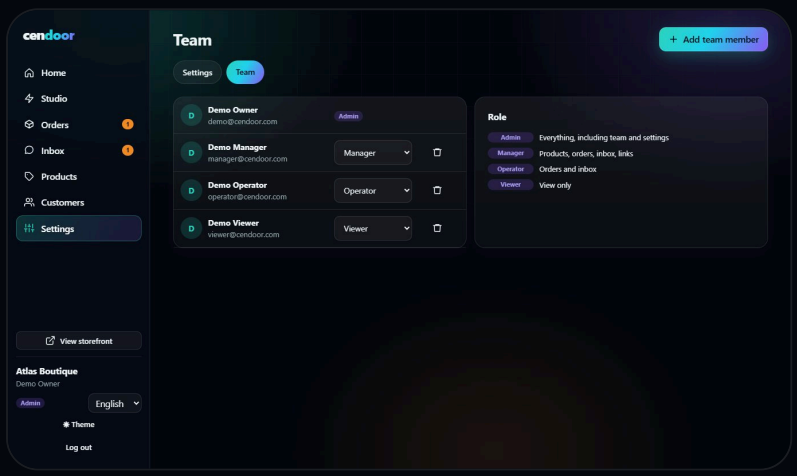

- Sales today and this month, orders, delivery success
- Rating and review count
- Time saved and what Cendoor handled this month (orders created by chat, failed deliveries recovered, risky orders held)
- Sales for the last 14 days and the top products

Copilot: advice from the seller's own data

- "Urban Sneakers will sell out in about 5 days; reorder around 11"
- "Amana delivers 100% of your parcels, CashPlus only 54%: consider switching"
- The best-converting post, customers to win back, the failure rate

11 Team, settings and languages

Live in the demo

Team members and their roles.

Roles

ROLE	CAN
Admin	everything, including plan and team
Manager	orders, products, Studio, campaigns, ads, links
Operator	orders, inbox, labels, stock
Viewer	read only

Settings

Shop details and contact, carriers and city prices, free-shipping threshold, WhatsApp number, the confirmation agent on/off, plan and credits, light or dark mode.

Three languages

The dashboard, the shop and the messages work in Arabic (right to left), French and English. The AI also understands Darija and Arabizi when customers write that way.

One simple dashboard

Seven menu entries: Home, Studio, Orders, Messages, Products, Customers, Settings. Cash and delivery, Post links, Ads, Campaigns and Team are tabs inside them.

12 Security and data

What is protected

- Passwords hashed with scrypt and a per-user salt; sessions are random 256-bit tokens in a secure cookie
- Role-based permissions on every action
- Rate limits on login, signup, chat, orders, tracking, campaigns and ads
- Generated websites pass a strict allow-list filter: no scripts, forms or remote images
- Ad-account tokens encrypted at rest; phone numbers hashed in the shared fraud signal
- The customer can reply STOP at any time

What is not in place yet

- No external security audit or penetration test
- No two-factor authentication and no audit log
- Single small server; automated backups still to be added
- The company is not registered, the data-protection (CNDP) declaration is not filed, and the terms and privacy policy are drafts for a lawyer

More detail is in the security overview and the legal drafts of the documentation pack. The seller owns their shop and customer data; Cendoor processes it on the seller's behalf.

13 Plans and pricing

Founding 50

99 MAD

per month, locked for 12 months for the first 50 sellers. 14-day free trial, no card.

Solo

149 MAD

per month. Shop, AI chat, confirmation, labels, tracking, cash. Unlimited orders and basic customisation.

Growth

299 MAD

per month. Everything in Solo, team seats, 100 AI design credits a month, priority support.

Each paying seller leaves about 126 MAD a month after direct costs (an estimate); break-even is about 24 paying sellers before any founder pay. A per-confirmed-order plan is to be tested. Billing is not connected yet: the plan and credits are recorded but nothing is charged.

✓ What is live today, and what is not

The demo is a working product with fictional data. Some parts depend on other companies; those are marked honestly.

PART	STATUS	WHAT IS NEEDED
Shop builder, Studio, edit text and photos	Live in the demo	Nothing for the rule-based version
Customer chat and ordering (web)	Live in the demo	Real Darija conversations to measure quality (the pilot)
Confirmation agent, risk check, orders, labels, CSV	Live in the demo	Approve-before-send mode to build
Tracking page, cash tracking, recovery, reviews	Live in the demo	Real carrier feeds replace the simulation button
Campaigns with targeting, post links, copilot	Live in the demo	WhatsApp sending needs approval (one-tap links today)
WhatsApp sending and receiving	Needs Meta approval	A registered business, verification and approved templates
Instagram and TikTok messages	Needs platform approval	Approval from each platform
Launching ads on Meta	Dry run Needs Meta approval	A Meta app with advanced access for other sellers' accounts
Live carrier tracking	Simulated	Carrier API access

Billing and payments	Not connected	A payment method and the registered company
Claude-written pages and free-form Studio	Needs an AI key	An API key; never yet run live
Approve-before-send, kill switch, customer export, per-order plan	Planned	Built first in the roadmap

Customers and revenue: there are no paying customers yet. The next step is a free 30-day pilot with 3 to 10 real sellers, measuring their orders confirmed, refused deliveries and hours saved, before and after.

? Questions

- **Is this live with WhatsApp?** +
- **Does the AI understand Darija?** +
- **What if the AI says something wrong to a customer?** +
- **Is the website a template?** +
- **Who owns the customer data?** +
- **How does the seller pay for ads?** +
- **What does it cost?** +
- **Who else does this?** +

See it for yourself

Open the live demo, log in as the demo owner, and place an order in the shop chat.

Demo login: demo@cendoor.com / demo1234 (fictional data, resets on restart)
